

Option B · DRBD single-primary

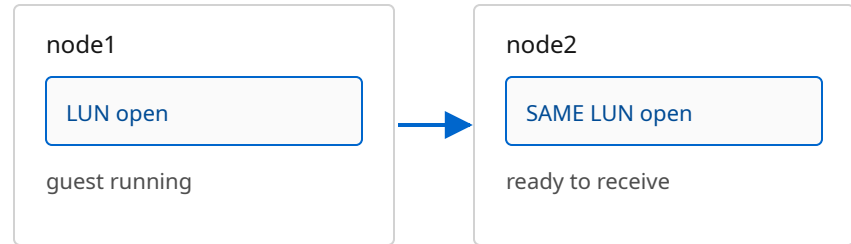

error: Unsafe migration: Migration without shared storage is unsafe

Pacemaker falls back to stop-and-start — the guest **RESTARTS** to move.

Measured cost of a planned move: about 12 seconds of guest downtime.

Live migration on DRBD would need dual-primary plus a cluster filesystem (GFS2), adding DLM and lvmlockd to every node and making fencing correctness load-bearing rather than merely important. A materially heavier design.

Option A · shared LUN, for contrast

live migration succeeds — the guest never restarts

Both hosts have the disk open at the same time, which is what live migration requires. Measured: about 1.2 seconds.
